The background features a dark green to black gradient with a grid of glowing green lines. Two large, semi-transparent spheres are visible, one in the foreground and one in the background, both with a grid pattern. A bright green lens flare is positioned in the lower-left quadrant. Diagonal lines in a light purple color cross the scene.

Hybrid Protocols in Neurobehavioral Research

**1st ISBS Summer School
St. Petersburg, Russia
May 9th -15th,2008**

Challenges in behavioral neuroscience and psychopharmacology

Practical

- ↑ costs (space, animal, etc.)
- high variability of data
- animal welfare concerns

Conceptual

- incorrect dissection of phenotypes
- ↑ number of mutant animals/drug effects to phenotype
- ↑ complexity of phenotypes/drug effects

Traditional phenotyping approaches

Most neurophenotyping techniques are:

- focusing on a single domain/disorder
- time-consuming
- may be expensive

This highlights the need for ↑ through-outputsful models

Solutions

- Test batteries
- Consider previous experience of model in each stage of tests

This promotes efficiency and high-throughput

Forced Swim Test

Morris Water Maze

Elevated Plus Maze

Traditional phenotyping

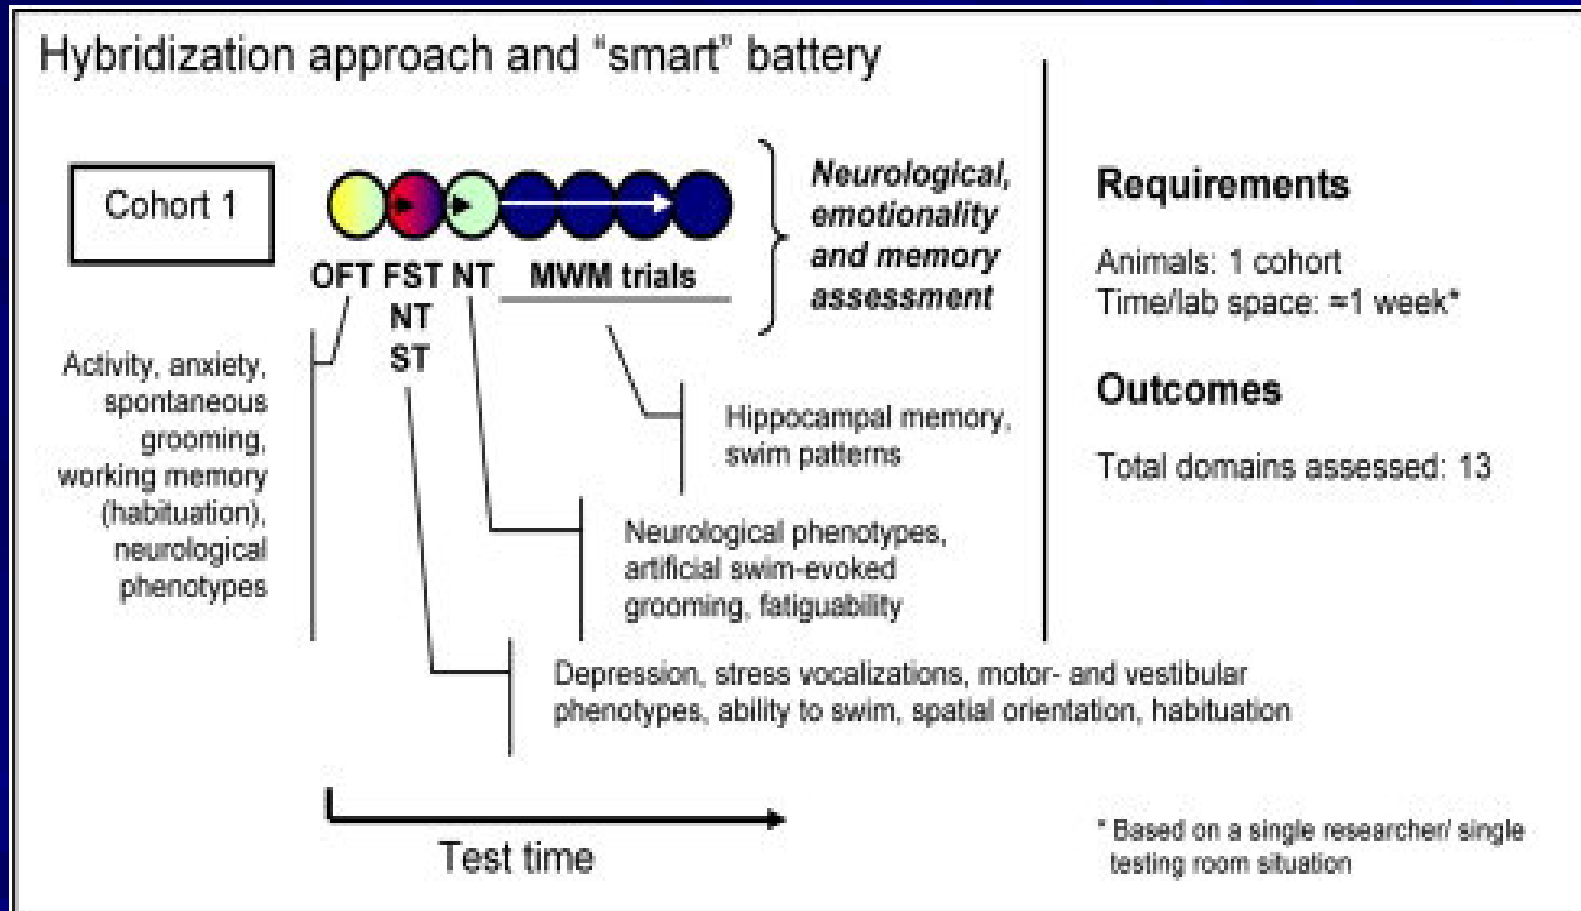

Kalueff et al., 2008. Prog NeuroPsychopharmacol Biol Psychiatry

What are hybrid models?

Hybridizing concept:

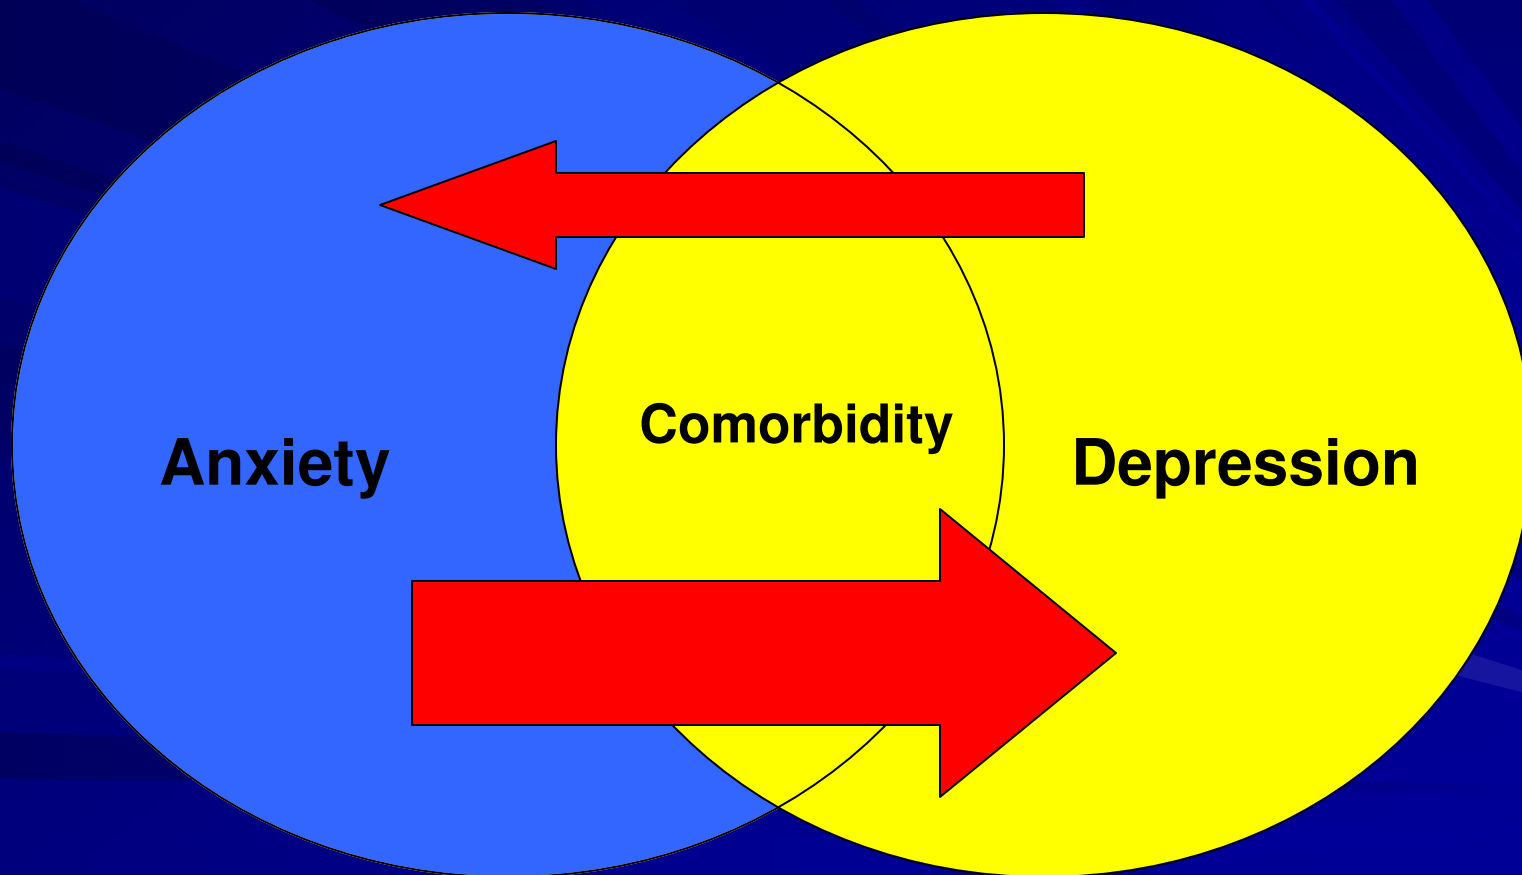

- Protocols that assess multiple domains in parallel
- “Smart batteries” - protocols that logistically combine experimental paradigms to maximize the number of tested phenotypes per experimental manipulation.

“Hybrid” approach

Kalueff et al., 2008. Prog NeuroPsychopharmacol Biol Psychiatry

Comorbidity of anxiety and depression

Example 1: Hybridization approach - chronic social defeat paradigm in mice

- Mimics anxiety and depression in males
- Requires 20 days of repetitive social defeat

C57 mice
Chronic social defeat

Social defeat model

Social stress-based model (Kudryavtseva, 1998)

- social winners or losers in male mice
- daily social confrontations
- daily non-contact exposures to winners
- anxiety (10 days) and depression (20 days)
- sensitivity to antidepressants or anxiolytic drugs

Pathophysiology

- ↑ DA and ↓ 5HT (winners), ↑ opioid system (losers)
- ↑ immune deficiency
- ↑ susceptibility to transplanted tumor growth

Bridging behavior and genetics

Aggressive mice:

- ↓ mRNA of catechol-O-methyltransferase
- ↑ mRNA of DAT and tyrosine hydroxylase

Submissive mice:

Repeated defeats ↑ mRNA of SERT, MAOA

Applications to humans

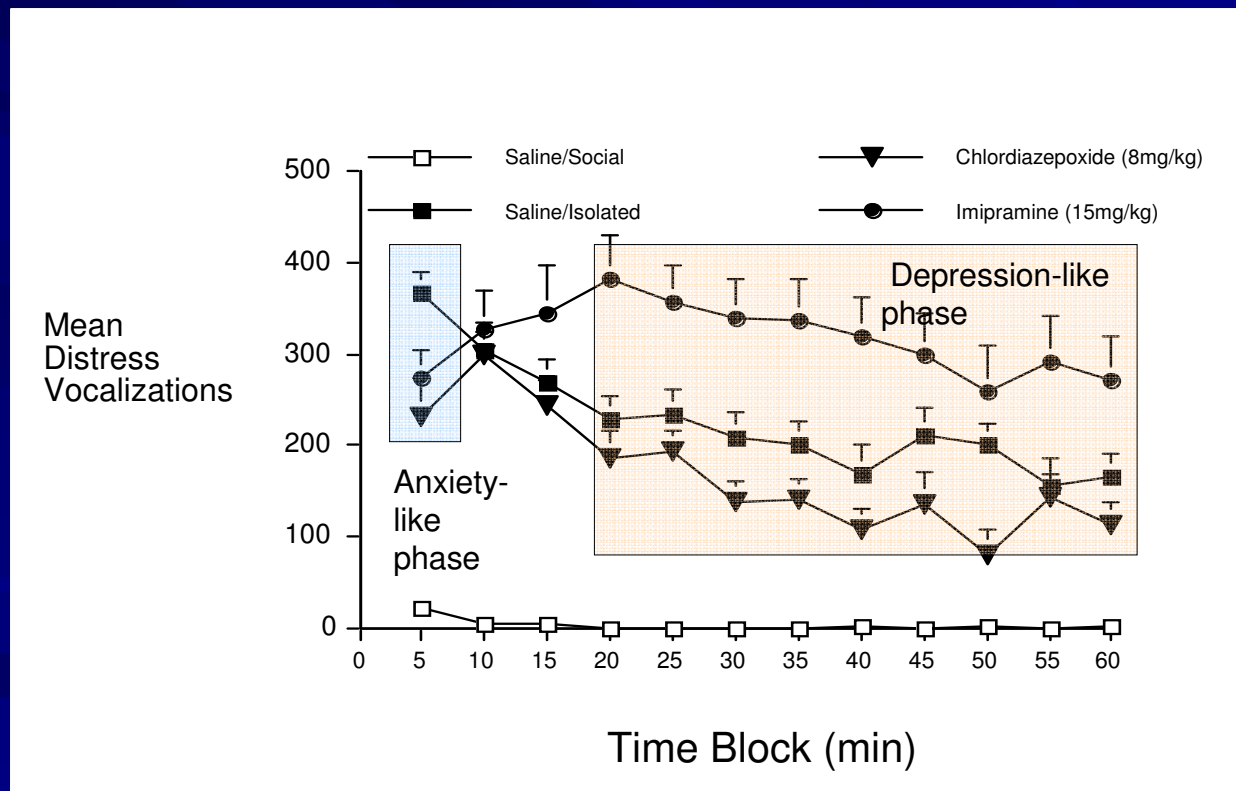

Complex mouse behavior

- Berton et al. Science, 2006
- Kalueff et al. Science, 2006

Example 2: Hybridization approach - 2 domains tested in 60 min in chicks

- Socially-raised chicks were separated from peers
- Their “distress vocalizations were recorded

Advantages of Hybrid Models

- Easy implementation
- Can assess more domains/disorders per experiment
- Reduction of animal numbers/suffering
- Target several behavioral endpoints
- High-throughput
- Less expensive (than a battery of single-domain models)
- Can mimic more complex clinically-relevant phenomena (e.g. comorbidity)
- Can “net” complex phenotypes

Example 3: The Suok test of anxiety and balancing

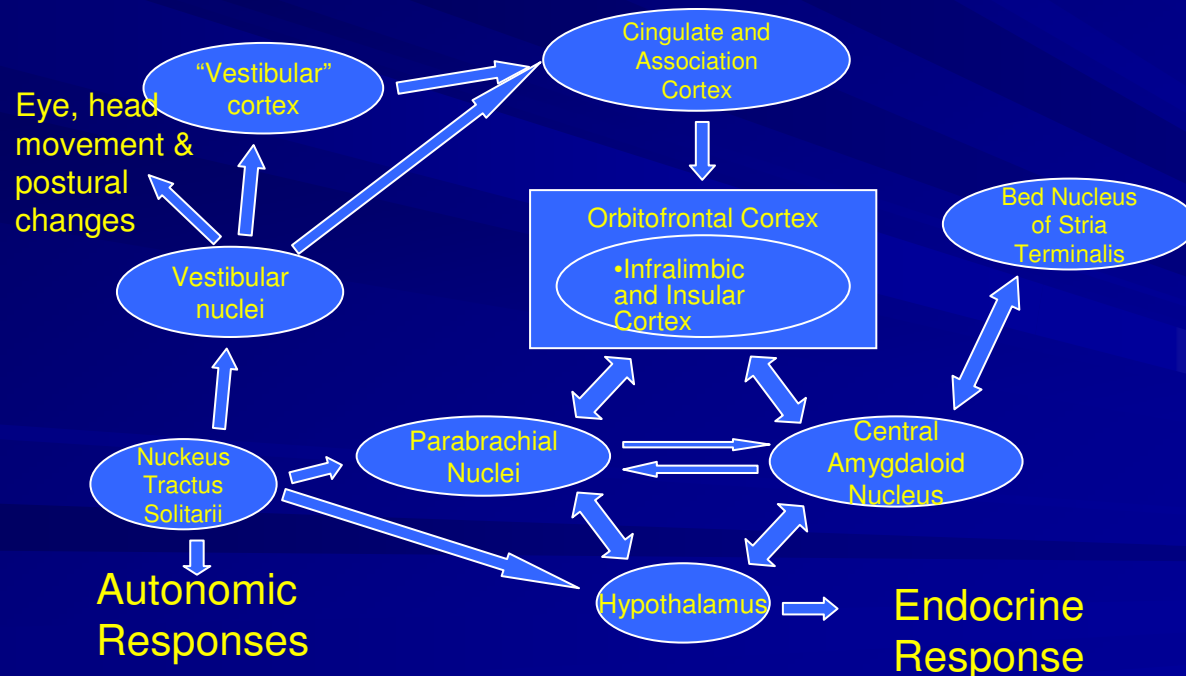

Neurobiological Rationale: Domains tested

- Anxiety
- vestibular disorders
- coordination

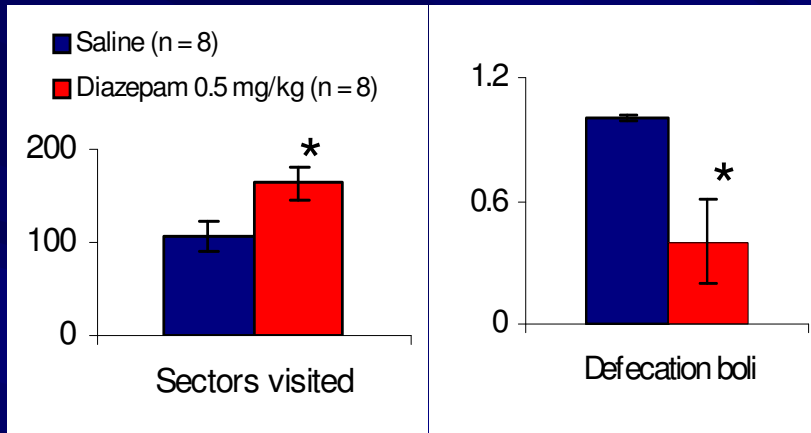

- anxiety-vestibular interplay
- balancing
- motor control

Common neural circuits for anxiety and balancing

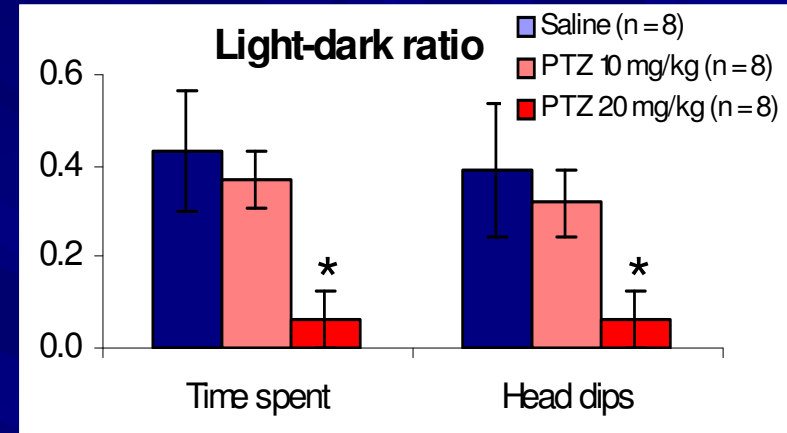

Suok Test pharmacology

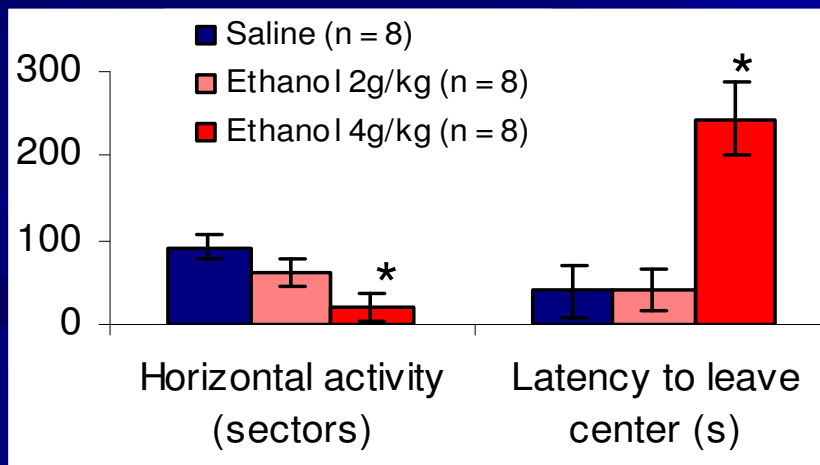

Regular BALB/c mice

Light/dark BALB/c mice

129S1 mice

129S1 mice

Animal behavioral
performance on the
regular Suok test
(CD-1 mice)

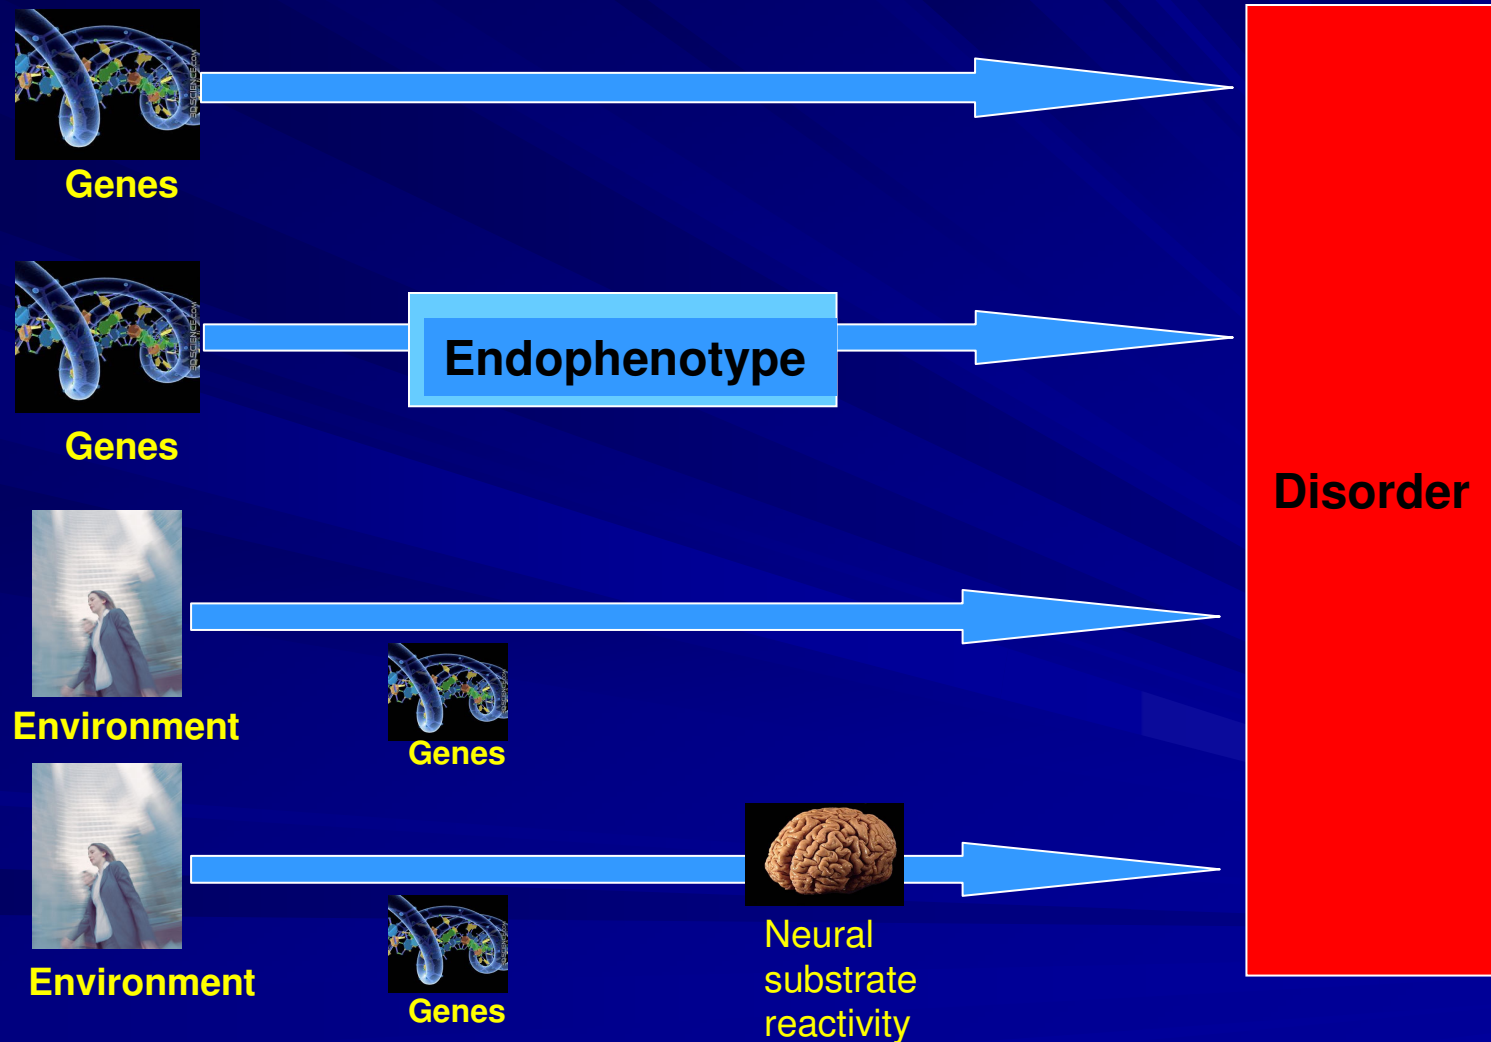

Other “hybrid” protocols

Stress hyperthermia	Baseline temperature assay, anxiety
Grooming sequencing	Anxiety, OCD-like phenotypes, Tourette’s syndrome-like phenotype
Wheel running	Motor activity, circadian rhythms, social stress, anxiety
Chronic stress paradigm	Anhedonic depression, anxiety, motor activity

Other “hybrid” protocols

Compulsive drug intake	Reward, drug abuse phenotype, OCD-like phenotypes
Tail suspension test	Depression (immobility), vestibular abnormalities (spinning), specific neurological phenotypes.
Marble burying	Anxiety, motor activity, OCD-like phenotype
Social interaction	Anxiety, activity, aggression, autism-like phenotypes
Y- or T-maze	Spontaneous alternation, spatial memory, anxiety, OCD-like phenotypes

Traditional concepts in biological psychiatry

Caspi et al., 2006

Domain interplay concept

Domain interplay concept

Generalized anxiety

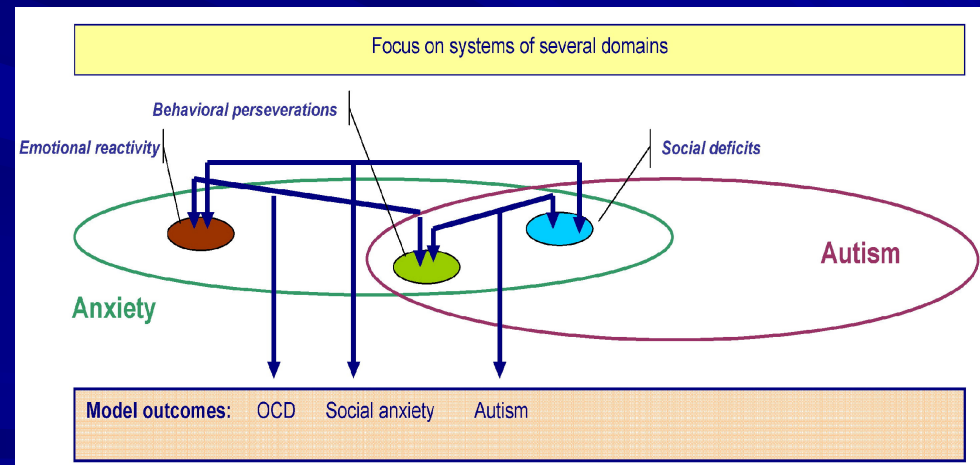

Obsessive-compulsive disorder

Autism

- parallel overlaps seen in clinical data
- better dissect comorbid disorders
- improve construct validity of models
- elucidate pathogenesis

Kalueff et al., 2008. Behav Brain Res

Integrating hybrid and domain concepts

The hybrid concept meshes with domain interplay

Hybrid modeling

Domain-oriented
modeling

Both concepts:

- Targets several (at least two) domains

Conclusions

- The use of hybrid models is an important strategy in behavioral neuroscience research
- The hybridizing approach, in combination with the domain interplay concept, may accelerate the discovery of new pathogenetic mechanisms of brain disorders, and their integrative modeling
- This approach, based on a wider use of hybrid multi-domain models, may help discover new genes and drugs to treat brain disorders – which is the ultimate goal of our research

BALDWIN

Dear medication,
How are you?
I'm feeling much better -
thanks to you....

Finally she began responding to
treatment.
